Antivirus computer program AVG AntiVirusDeveloper(s)Gen Digital Inc.Operating systemWindows XP and later, macOS, AndroidTypeAntivirus softwareLicenseFreemiumWebsiteavg.com AVG AntiVirus (previously known as AVG, an abbreviation of Anti-Virus Guard) is a line of antivirus software developed by AVG Technologies, a subsidiary of Avast, a part of Gen Digital.[1][2] It is available for Windows, macOS and Android. Main article: AVG Technologies The brand AVG comes from Grisoft's first product, Anti-Virus Guard, launched in 1992 in the Czech Republic. In 1997, the first AVG licenses were sold in Germany and the UK. AVG was introduced in the US in 1998.[3] The AVG Free Edition helped raise awareness of the AVG product line.[4] In 2006, the AVG security package grew to include anti-spyware as AVG Technologies acquired ewido Networks, an anti-spyware group. AVG Technologies acquired Exploit Prevention Labs (XPL) in December 2007 and incorporated that company's LinkScanner safe search and surf technology into the AVG 8.0 security product range released in March 2008. In January 2009, AVG Technologies acquired Sana Security, a developer of identity theft prevention software. This software was incorporated into the AVG security product range in March 2009.[citation needed] According to AVG Technologies, the company has more than 200 million active users worldwide, including more than 100 million who use their products and services on mobile devices.[5] On 7 July 2016, Avast announced an agreement to acquire AVG for $1.3 billion.[6] AVG provides AVG AntiVirus Free for Windows, AVG AntiVirus for Mac for macOS and AVG AntiVirus for Android for Android devices. All are freemium products: They are free to download, install, update and use, but for technical support a premium plan must be purchased.[citation needed] AVG stopped providing new features for Windows XP and Windows Vista in January 2019. New versions require Windows 7 or later; virus definitions are still provided for previous versions.[7] AVG features most of the common functions available in modern antivirus and Internet security programs, including periodic scans, scans of sent and received emails (including adding footers to the emails indicating this), the ability to repair some virus-infected files, and a quarantine area (virus vault) in which infected files are held.[citation needed] The LinkScanner technology acquired from Exploit Prevention Labs and built into most AVG products, provides real-time updated protection against exploits and drive-by downloads. LinkScanner includes: Search-Shield – a safe search component that places safety ratings next to each link in Google, Yahoo! and MSN search results; plus Active Surf-Shield – a safe surf component that scans the contents of a web site in real-time to ensure it's safe being opened.[8] Concerns regarding web analytics have made LinkScanner a controversial component (see "LinkScanner concerns" below). When AVG 8.0 was first released, its LinkScanner safe search feature was shown to cause an increase in traffic on websites that appear high in search engine results pages. Since LinkScanner disguises the scans as coming from an Internet Explorer 6 browser when it prescans each site listed in the search results, website usage logs showed incorrect and overinflated site visitor statistics. The prescanning of every link in search results also caused websites to transfer more data than usual, resulting in higher bandwidth usage for web site operators and slow performance for users.[9] AVG initially said that site administrators would be able to filter the LinkScanner traffic out of their site statistics, leaving the problem of excess bandwidth usage still to be solved.[10] Pay-per-click advertising was not affected by the increase in traffic.[11] AVG Online Shield is a feature designed to check files and ensure that they are safe. AVG Online Shield also ensures the safety of exchanging files via instant messengers and VoIP clients.[12] In response to complaints, AVG announced that as of 9 July 2008 "Search-Shield will no longer scan each search result online for new exploits, which was causing the spikes that webmasters addressed with us",[13] releasing a new build on that date that applies a local blacklist, then prefetches and scans only those links clicked on by the user.[14] As of 2014, there are numerous reports dating back to 2012 that the AVG SafeGuard Toolbar installs itself without the consent of the user, as a side effect of installing other applications. The toolbar program appears to cause significant RAM issues and can be considered an intrusive potentially unwanted program (PUP). Once installed, the AVG toolbar is virtually impossible to remove. The toolbar uninstaller does not function, instead re-installing the add-on if manually removed. Consequently, many discussions and blog posts have described complex procedures for removal of the AVG toolbar, each with very mixed results.[15][16][17][18][19][20] In September 2015, AVG announced that it would start tracking users for profit, analyzing their data for sale to the advertising industry. This measure received criticism from consumers, the press and security industry, as many users intended to use the software in order to protect themselves from spyware and would not expect the functions of spyware to be "hidden" in security software.[21] In December 2015, the AVG Web TuneUp Google Chrome extension (automatically installed with AVG AntiVirus) was revealed to contain multiple critical security vulnerabilities.[22] Most notably, Chrome users' browsing history could be exposed to any website, cookies from any site the user has visited could be read by an attacker, and trivial cross-site scripting (XSS) issues could allow any website to execute arbitrary code (as another domain). The XSS vulnerability allowed a user's mail from "mail.google.com" to be read by any website, or financial information to be read from the user's online banking site. The AVG team fixed this by only allowing "mysearch.avg.com" and "webtuneup.avg.com" to execute these scripts. Despite this remediation, attackers could leverage any of these attacks if an XSS vulnerability was found on the AVG sites. As of April 2016, Web TuneUp was still not available for download from the AVG website. But if you're after a free antivirus for Windows 10 or 11 that offers stronger features without dragging down your system, AVG AntiVirus Free is a strong upgrade.AVG provides real-time protection against viruses, spyware, ransomware, and phishing attempts. It runs quietly in the background with minimal impact on performance and avoids constant nagging or unnecessary notifications.AVG AntiVirus Free is a straightforward security tool with essential malware protection through a simple, clean interface. It includes web and email scanning, along with customizable scan options and a behavior-based threat detection engine.Unlike trialware or bloated security suites, AVG Free is a permanent, no-cost solution with solid core features and a clean install process.Compared to Microsoft Defender, AVG AntiVirus Free offers greater flexibility, enhanced customization, and more comprehensive control over your system’s protection. It includes features like real-time web and email shields that scan downloads and attachments, helping to block phishing attempts before they cause trouble—something Defender doesn’t fully cover unless you're tied into the Microsoft ecosystem. AVG’s behavior-based detection is also more proactive, monitoring how programs behave rather than just relying on known threats. For users on older or lower-spec PCs, AVG often runs lighter and gives more consistent performance.Real-Time Protection that scans files and apps as they runEmail Shield that checks attachments for threatsWeb Protection that warns against harmful links and downloadsBehavior Shield that monitors for suspicious activityScheduled Scans for convenience and flexibilityOS: Windows 7, 8.1, 10, and 11 (32-bit and 64-bit)License: FreewareInstaller Type: Standard install only (no portable version)Resource Usage: Optimized for low CPU and memory consumptionPros:Easy to install and useStrong real-time protectionRuns well even on older hardwareAutomatic background updatesNo expiration or trial limitCons:Some features like file encryption and a firewall are locked behind the paid versionUpgrade prompts appear occasionallyLacks a portable versionFor most users, AVG AntiVirus Free provides enough day-to-day protection. But if you want to go further, pairing it with Malwarebytes Free adds on-demand scanning to catch things AVG might miss. You can also add Revo Uninstaller Free to help remove stubborn or leftover software that traditional uninstallers leave behind.This kind of layered setup is ideal for keeping your system secure, clean, and fast without needing to pay up for a full security suite.Similar: What's the Best Antivirus and Is Windows Defender Good Enough?
